#### Abstract

Two novel molybdenum $(\mathrm{V})$ complexes, $\left[\mathrm{Mo}_{2} \mathrm{O}_{4}(\mathrm{acac})_{2}(\mathrm{gly})\right](\mathrm{EtOH})\left(\mathrm{H}_{2} \mathrm{O}\right), \mathbf{1}$, and $\left[\mathrm{Mo}_{2} \mathrm{O}_{4}(\mathrm{acac})_{2}(\mathrm{D}, \mathrm{L}-\mathrm{val})\right]$, 2, $(\mathrm{acac}=$ acetylacetonato, $\mathrm{EtOH}=$ ethanol $)$, were synthesized by the reaction of $\left[\mathrm{Mo}_{2} \mathrm{O}_{3}(\mathrm{acac})_{4}\right]$ and amino acids glycine and D,Lvaline, respectively. The complexes were characterized by elemental and IR spectral analysis. Their structures were determined by the single crystal X-ray diffraction method. Both complexes are dinuclear, with singly bonded Mo-Mo in the $\left\{\mathrm{Mo}_{2} \mathrm{O}_{4}\right\}^{2+}$ core, a carboxylato bridging amino acid, and with each Mo atom additionally coordinated by a bidentate acetylacetonato ligand. Crystal data: $\mathrm{C}_{14} \mathrm{H}_{27} \mathrm{Mo}_{2} \mathrm{NO}_{12}(\mathbf{1})$ crystallizes in the monoclinic system, space group $P 2_{1} / n$, with $a=8.439(2), b=20.613(4), c=12.639(3) \AA, \beta=98.410(10)^{\circ}, Z=4, \mathrm{C}_{15} \mathrm{H}_{25} \mathrm{Mo}_{2} \mathrm{NO}_{10}(\mathbf{2})$ crystallizes in the orthorhombic system, space group Pbca with $a=13.596(1), b=19.346(1), c=15.080$ (1) $\AA, Z=8$.

Keywords: Molybdenum(V) complexes; crystal structure; amino acid complexes

## 1. Introduction

Molybdenum is an essential metal in almost all organisms and occurs in many enzymes. ${ }^{1}$ The importance of investigating molybdenum complexes with amino acids as possible molybdoenzyme model compounds was recognized as long as 40 years ago. ${ }^{2,3}$ The dinuclear fragment $\left\{\mathrm{Mo}_{2} \mathrm{O}_{4}\right\}^{2+}$, which is also present in the two structures described here, can often be found as the building unit in the chemistry of molybdenum $(\mathrm{V})$. In this fragment each molybdenum atom is bound to two bridging oxygen atoms and one terminal oxygen atom. There can also be an additional ligand such as the carboxylato group acting as a bridging $\mu_{2}, \eta^{1}: \eta^{1}\left(O, O^{\prime}\right)$ ligand. ${ }^{4,5}$ Structures of many acetato complexes of molybdenum(V) with the $\left\{\mathrm{Mo}_{2} \mathrm{O}_{4}\right\}^{2+}$ units as building block are known. They can be dinuclear ${ }^{6}$ or can assemble into oligonuclear species. ${ }^{6,7}$ Molybdenum atoms in the dinuclear complexes can also
be doubly bridged by sulphur atoms as in $\left[\mathrm{Mo}_{2} \mathrm{O}_{2} \mathrm{~S}_{2}\right.$ (histidine $\left.)_{2}\right]^{8}$ or $\left.\left[\mathrm{Mo}_{2} \mathrm{O}_{2} \mathrm{~S}_{2} \text { (L-cysteine) }\right)_{2}\right] .{ }^{9}$

The first crystal structures of dinuclear molybdenum $(V)$ complexes with the $\left\{\mathrm{Mo}_{2} \mathrm{O}_{4}\right\}^{2+}$ core and with amino acids as ligands were those of $\left[\mathrm{Mo}_{2} \mathrm{O}_{4}\right.$ (L-his) $\left.)_{2}\right] \cdot 3 \mathrm{H}_{2} \mathrm{O}{ }^{10}$ and $\mathrm{Na}_{2}\left[\mathrm{Mo}_{2} \mathrm{O}_{4}(\text { L-cys })_{2}\right] \cdot 5 \mathrm{H}_{2} \mathrm{O} .{ }^{11} \mathrm{Ho}-$ wever in these two structures the amino acid is not bridging, the L-histidinato ligand is tridentately $\mathrm{N}, \mathrm{N}, \mathrm{O}$-bound to each Mo, while the L-cysteinato ligand is $\mathrm{S}, \mathrm{N}, \mathrm{O}$-bound to each molybdenum atom. The structure of $\mathrm{Na}_{2}\left[\mathrm{Mo}_{2} \mathrm{O}_{4}\right.$ (L-cys) $)_{2}$ • $5 \mathrm{H}_{2} \mathrm{O}$ was later redetermined by neutron diffraction. ${ }^{12}$ The crystal structure of another polymorph of $\left[\mathrm{Mo}_{2} \mathrm{O}_{4}(\mathrm{~L}-\mathrm{his})_{2}\right] \cdot 3 \mathrm{H}_{2} \mathrm{O}$ was recently determined and a similar molecular structure as that of Knox and Prout was found. ${ }^{13}$

Two structures of binuclear complexes with the $\left\{\mathrm{Mo}_{2} \mathrm{O}_{4}\right\}^{2+}$ core and with molybdenum atoms bridged through the carboxylic atoms of the corresponding amino
acid are known. One is the structure of $\mu$-glycine- $O: O^{\prime}$-di-$\mu$-oxo-bis[(glycinato- $N, O$ )oxomolybdenum $(\mathrm{V})]^{14}$ where one glycine is $\mu_{2}$-bridging and the other is a glycinato ligand that is $\mathrm{N}, \mathrm{O}$-bound to each molybdenum. The other is that of $\left[\mathrm{Mo}_{2} \mathrm{O}_{4}(\mathrm{acac})_{2}\right.$ thala] $\cdot 3 \mathrm{EtOH}(\mathrm{acac}=$ acetylacetonato; thala $=3$-(2-thienyl)-D,L-alanine). ${ }^{15}$ Several structures that have $\left\{\mathrm{Mo}_{2} \mathrm{O}_{4}\right\}^{2+}$ fragments linked into polynuclear complexes with bridging amino acids, mostly glycine or alanine, have been reported. ${ }^{16-21}$

In this paper, we report the synthesis and crystal structures of two new dinuclear complexes of molybdenum with amino acids: di- $\mu$-oxo- $\mu$-[glycine- $\left.O: O^{\prime}\right]$ -bis[oxo2,4-pentanedionatomolybdate $(\mathrm{V})$ ] solvated with ethanol and water, $\left[\mathrm{Mo}_{2} \mathrm{O}_{4}(\mathrm{acac})_{2}(\mathrm{gly})\right] \cdot(\mathrm{EtOH})\left(\mathrm{H}_{2} \mathrm{O}\right), \mathbf{1}$, and di- $\mu$-oxo- $\mu$-[D,L-valine-O:O']-bis[oxo(2,4-pentanedionato)molybdate(V)], $\left[\mathrm{Mo}_{2} \mathrm{O}_{4}(\mathrm{acac})_{2}(\mathrm{D}, \mathrm{L}-\mathrm{val})\right], \quad 2$, (Scheme 1). Both complexes were characterized by chemical analysis and IR spectroscopy, and their crystal structures were determined by single crystal X-ray diffraction.

## 2. Experimental

## 2. 1. Materials and Methods

All solvents and chemicals were of commercial reagent grade; all reactions were carried out under an atmosphere of purified nitrogen. Complex $\left[\mathrm{Mo}_{2} \mathrm{O}_{3}(\mathrm{acac})_{4}\right]$ was prepared as described in literature..$^{22,23}$ The IR spectra were recorded on a FTIR 1600 Fourier-transform spectrophotometer, using the KBr pellet technique, in the $4500-450 \mathrm{~cm}^{-1}$ region. Molybdenum was analytically determined according to the procedure given in the literature. ${ }^{24}$

### 2.2. Synthesis and Characterization

Di- $\mu$-охо- $\mu$-[glycine- $O$ : $O^{\prime}$ ']-bis-[oxo(2,4-pentane-dionato)molybdate(V)]-ethanol(1/1)-water(1/1), $\left[\mathrm{Mo}_{2} \mathrm{O}_{4}\right.$ (acac) $\left.)_{2} \mathrm{gly}\right](\mathrm{EtOH})\left(\mathrm{H}_{2} \mathrm{O}\right), \mathbf{1}$
$\mathrm{Mo}_{2} \mathrm{O}_{3}(\mathrm{acac})_{4}(0.635 \mathrm{~g}, 1 \mathrm{mmol})$ was dissolved in 20 ml of boiling ethanol in a nitrogen atmosphere. The dark red mixture was hot filtered, heated again till boiling, an aqueous solution of glycine $(0.075 \mathrm{~g}$ of glycine in 1.5 ml
of boiled water) was then added and heated in nitrogen stream for several hours. After several days at room temperature red-brown crystalline product was obtained. Anal. Calc. For $\mathrm{Mo}_{2} \mathrm{O}_{12} \mathrm{C}_{14} \mathrm{H}_{27} \mathrm{~N}: \mathrm{C}, 28.33, \mathrm{H}, 4.55, \mathrm{~N}$, $2.36 \%$. found: C,23.26, $\mathrm{H}, 3.31, \mathrm{~N}, 2.76 \%$. $\operatorname{IR}(\mathrm{KBr})$, $\left(\mathrm{cm}^{-1}\right): 1556(\mathrm{~s}) ; 1421(\mathrm{~m}) ; 964(\mathrm{~s}) ; 741(\mathrm{~m})$.

Di- $\mu$-oxo- $\mu$-[D,L-valine- $O: O^{\prime}$ ]-bis[oxo(2,4-pentanedionato)molybdate(V)], $\left[\mathrm{Mo}_{2} \mathrm{O}_{4}(\mathrm{acac})_{2} \mathrm{D}, \mathrm{L}-\mathrm{val}\right], 2$
0.635 g of $\mathrm{Mo}_{2} \mathrm{O}_{3}(\mathrm{acac})_{4}(1 \mathrm{mmol})$ was dissolved in 35 ml ethanol, boiled under nitrogen atmosphere and than hot filtered. A solution of D,L-valine ( $0.117 \mathrm{~g}, 1 \mathrm{mmol}$ ) was added to the filtrate and heated for several hours. On the next day, light-red crystals of 2 were obtained. Anal. Calc. for $\mathrm{Mo}_{2} \mathrm{O}_{10} \mathrm{C}_{15} \mathrm{H}_{25} \mathrm{~N}$ : C, 31.53, $\mathrm{H}, 4.37, \mathrm{~N}, 2.45 \%$. found: C, 31.63, $\mathrm{H}, 4.28, \mathrm{~N}, 2.37 \%$. $\mathrm{IR}(\mathrm{KBr}),\left(\mathrm{cm}^{-1}\right)$ : 1612 (s); 1431 (m); 961 (s); 743 (m).

## 2. 3. X-ray Structure Analysis

Single, red colored, crystals of $\mathbf{1}$ and $\mathbf{2}$ were grown by slow evaporation of the corresponding solutions obtained from the above described preparations. The X-ray diffraction intensities for compound 1 were collected at room temperature on a Philips PW1100 difractometer updated by Stoe and $\mathrm{Cie}^{25}$ using $\mathrm{Mo}-K_{\alpha}$ radiation ( $\lambda=$ $0.7107 \AA$ ) with the scan mode. Data were reduced using X-RED. ${ }^{26}$ Intensity data for compound 2 were collected at 200 K on a Nonius KappaCCD difractometer with graphite-monochromated $\mathrm{Mo}-K_{\alpha}$ radiation and the data were reduced using the $\mathrm{DENZO}^{27}$ program. The crystal structures were solved by direct methods using the SHELXS $97^{28}$ program. All non-hydrogen atoms were refned anisotropically by full-matrix least-squares calculations based on $F^{2}$ with the SHELXL97 ${ }^{29}$ program. Hydrogen atoms in 1 could be found in the difference Fourier map, however, since the geometry was poor they were placed at ideal calculated positions (aromatic, secondary), or using the rotating group refinement (methyl, amino, hydroxyl groups) with atoms placed at density maxima. The displacement parameters were taken as 1.2 times (aromatic, secondary), and 1.5 times of their parent atoms (methyl, amino and hydroxyl groups, $\mathrm{H}_{2} \mathrm{O}$ molecule). For the $\mathrm{H}_{2} \mathrm{O}$ molecule one hydrogen atom was found in the difference Fourier map while the other was calculated using CALC- $\mathrm{OH}^{30}$ and was included in the refinement with restrained geometry. In 2 all hydrogen atoms were located in the difference Fourier maps and refined isotropically. Geometry calculations were done using PLATON ${ }^{31}$ and PARST $^{32,33}$ and the structure drawings were prepared using PLATON and PLUTON programs. Crystal data and refinement details are listed in Table 1.

Compound 2 is a racemic compound. Although a mechanical mixture of two enatiomers is sometimes possible (racemic conglomerate), this was not observed in our case.

The crystallographic data for compounds 1 and 2 have been deposited with the Cambridge Crystallographic Data Center as supplementary material with the deposition numbers: CCDC 682621 for 1 and 682622 for $\mathbf{2}$. Copies of the data can be obtained, free of charge via http:/www.ccdc.cam.ac.uk/const/retrieving.html.

## 3. Results and Discussion

By direct reaction of $\left[\mathrm{Mo}_{2} \mathrm{O}_{3}(\mathrm{acac})_{4}\right]$ with the amino acids glycine and valine, dinuclear molybdenum complexes 1 and 2 with triply bridged molybdenum atoms were prepared. The diamagnetism of both complexes together with the short Mo-Mo bond indicate presence of a metal-metal bond. IR data indicate presence of the $\left\{\mathrm{Mo}_{2} \mathrm{O}_{4}\right\}^{2+}$ moiety. Absorption maxima that were found in the $1000-900 \mathrm{~cm}^{-1}$ and $750-700 \mathrm{~cm}^{-1}$ region are characteristic of the stretching of isolated $\mathrm{Mo}=\mathrm{O}$ and the bridging $\mathrm{Mo}-\mathrm{O}-\mathrm{Mo}$, respectively. Maxima typical for the acetylacetonate ligand and the amino acids were also found (Table 2).

## 3. 1. Molecular Structures of 1 and 2

Both complexes are dinuclear, with a $\left\{\mathrm{Mo}_{2} \mathrm{O}_{4}\right\}^{2+}$ core. The $\operatorname{Mo}\left(\mu_{2}-\mathrm{O}\right)_{2}$ Mo moiety is not planar. The fold angle is $165.81(16)^{\circ}$ and $163.96(5)^{\circ}$, in 1 and 2, respectively. The two molybdenum atoms are bridged by the carboxylato group from the amino acid (glycine in 1, Fig. 1, and valine in 2, Fig. 2), and with each Mo atom additionally coordinated by a bidentate acetylacetonato ligand. Selected bond distances and angles are given in Table 3. The Cambridge Structural Database ${ }^{34}$ was searched for structures containing the $\left\{\mathrm{Mo}_{2} \mathrm{O}_{4}\right\}^{2+}$ core, with a bridging carboxylato group, and with two additional oxygen atoms coordinated to each molybdenum atom. The search gave 26 hits. After supressing outliers from polynuclear structures, the following ranges and mean values were found for 28 such structural fragments: Mo-Mo distances from 2.549 to $2.602 \AA$, mean value $2.57 \AA$; Mo=O 1.653 $1.699 \AA$, mean $1.68 \AA$, Mo-O b 1.916-1.962 $\AA$, mean 1.94 $\AA$; Mo-O ${ }_{\text {carboxyl }} 2.221-2.419 \AA$, mean $2.34 \AA$; angle $\mathrm{Mo}-\mathrm{O}_{\mathrm{b}}-\mathrm{Mo} 81.94-84.77^{\circ}$, mean $83^{\circ}$. Oxygen atoms

Table 2. Characteristic IR absorption maxima $\left(\mathrm{cm}^{-1}\right)$ in 1 and 2

| Characteristic IR absorption maxima $\left(\mathbf{c m}^{-\mathbf{1}}\right)$ |  |  |  |  |  |  |

from the carboxylic group occupy a pair of trans sites to $\mathrm{Mo}=\mathrm{O}$, and lengthening of these $\mathrm{Mo}-\mathrm{O}$ bonds is due to the known trans effect. Values in $\mathbf{1}$ and $\mathbf{2}$ correspond well to these mean values: $\mathrm{Mo}-\mathrm{O}_{\mathrm{b}}$ distances range from 1.9344(11) ${ }^{\circ}$ to $1.950(4) \AA$ in $\mathbf{1}$ and $\mathbf{2}$, respectively. The Mo-Mo distances of 2.5678(10) $\AA$ in $\mathbf{1}$, and 2.5687(2) $\AA$ in 2 correspond to a single Mo-Mo bond. ${ }^{35,36}$ The $\mathrm{Mo}-\mathrm{O}_{\mathrm{acac}}$ distances, ranging from 2.086(5) to 2.1038(11) $\AA$, are in good agreement with previously determined similar structures. ${ }^{15,37-40}$ The $\mathrm{Mo}-\mathrm{O}_{\text {carboxyl }}$ distances fall within the above mentioned range and are from
2.2791(11) to 2.354(4) A. The overall structures are similar to that of $\left[\mathrm{Mo}_{2} \mathrm{O}_{4}(\mathrm{acac})_{2}\right.$ thala $] \cdot 3 \mathrm{EtOH}$ (thala $=3-(2-$ thienyl)-D,L-alanine). ${ }^{15}$ Octahedra around the Mo atoms are significantly distorted with angles ranging from 74.78(4) to 106.58(6). The amino acids in both structures are in the zwitter-ionic form.

## 3. 2. Crystal Structure of 1

The asymmetric unit consists of the complex molecule, ethanol and $\mathrm{H}_{2} \mathrm{O}$ molecules. The protonated amino

i: $1+x, y, z ;$ ii: $1-x,-y, 1-z$; iii: $1-x,-y, 1-z$; iv: $-x, 1-y, 1-z ;$ v: $-1 / 2+x, y, 1 / 2-z$
group is an excellent hydrogen bond donor and all three $\mathrm{N} 1-\mathrm{H}$ atoms are involved in hydrogen bonding, Table 3, Fig. 3. A molecule of $\left[\mathrm{Mo}_{2} \mathrm{O}_{4}(\mathrm{acac})_{2} \mathrm{gly}\right]$ is linked to its centrosymmetrically related pair by the hydrogen bonds $\mathrm{N} 1-\mathrm{H} 1 \mathrm{~F}$ to O 2 and O 5 , while the hydrogen bond N1-H1E…O2 links it to another neighbouring complex molecule. Through these hydrogen bonds the complex molecules are linked into infinite chains along the $a$ axis. The third hydrogen links it with a $\mathrm{H}_{2} \mathrm{O}$ molecule, $\mathrm{N} 1-\mathrm{H} 1 \mathrm{D} \cdots \mathrm{O} 11$. The $\mathrm{H}_{2} \mathrm{O}$ molecule is a donor toward a neighbouring complex molecule through $\mathrm{O} 11-\mathrm{H} 11 \mathrm{~A} \cdots \mathrm{O} 9$, and to the ethanol molecule $\mathrm{O} 11-\mathrm{H} 11 \mathrm{~B} \cdots \mathrm{O}$. The ethanol molecule forms another hydrogen bond with a complex

Figure 4. Packing of the molecules of $\left[\mathrm{Mo}_{2} \mathrm{O}_{4}(\mathrm{acac})_{2} \mathrm{gly}\right](\mathrm{EtOH})$ $\left(\mathrm{H}_{2} \mathrm{O}\right), \mathbf{1}$, in the unit cell.

Figure 5. Hydrogen bonding in 2 is shown by dashed lines, a: $-\mathrm{x}, 1-\mathrm{y}, 1-\mathrm{z}$. The weak $\mathrm{N} 1-\mathrm{H} \cdots \mathrm{O} 10$ hydrogen bond is not shown.

## Povzetek

Sintetizirali smo dva nova molibden $(\mathrm{V})$ kompleksa, $\left[\mathrm{Mo}_{2} \mathrm{O}_{4}(\mathrm{acac})_{2}(\mathrm{gly})\right](\mathrm{EtOH})\left(\mathrm{H}_{2} \mathrm{O}\right)$, 1, in $\left[\mathrm{Mo}_{2} \mathrm{O}_{4}(\mathrm{acac})_{2}(\mathrm{D}, \mathrm{L}-\mathrm{val})\right]$, 2, (acac $=$ acetilacetonato, $\mathrm{EtOH}=$ etanol $)$, z reakcijo $\operatorname{med}^{[ }\left[\mathrm{Mo}_{2} \mathrm{O}_{3}(\mathrm{acac})_{4}\right]$ in amino kislinama glicin and D,L-valin. Komplekse smo okarakterizirali z elementno in IR spektralno analizo. Strukturi smo določili z rentgensko difrakcijo na monokristalu. Oba kompleksa sta dinuklearna z enojno vezanim $\mathrm{Mo}-\mathrm{Mov}\left\{\mathrm{Mo}_{2} \mathrm{O}_{4}\right\}^{2+}$, z amino kislino vezano preko karboksilata ter z vsakim Mo atomom dodatno koordiniranim z bidentatnim acetilacetonato ligandom. Kristalografski podatki: $\mathrm{C}_{14} \mathrm{H}_{27} \mathrm{Mo}_{2} \mathrm{NO}_{12}$ (1) kristalizira v monoklinskem sistemu, prostorska skupina $P 2_{1} / n, a=8.439(2), b=20.613(4)$, $c=12.639(3) \AA, \beta=98.410(10)^{\circ}, Z=4 ; \mathrm{C}_{15} \mathrm{H}_{25} \mathrm{Mo}_{2} \mathrm{NO}_{10}(2)$ kristalizira v ortorombičnem sistemu, prostorska skupina $P b c a, a=13.596(1), b=19.346(1), c=15.080(1) \AA, Z=8$.
